Recharging Test Automation

Contents

Is your automation in need of recharging?

Instigating a pilot project

Objectives

Organisational structures

Measuring to monitor and set targets

Need a top-up?

- has automation fallen short of expectations?
 - is it delivering fewer and smaller benefits?
 - is it difficult to see how to improve?
 - does it still take lots of effort to automate?
 - is test maintenance a growing problem?
 - are automated tests available at any time?
 - is improving automation someone's job?
-

Is your automation in need of recharging?

Instigating a pilot project

Objectives

Organisational structures

Measuring to monitor and set targets

Why a pilot project?

- **allow time out to research and experiment**
 - try new ideas in safety without undue pressure
 - set milestones for deliverables
 - demonstrable achievements
 - **tackle persistent problems**
 - if they're not solved early on people may have learnt to tolerate them – this costs!
 - **visibility of importance of automation**
 - take it seriously, encourage creative ideas
-

Pilot project (if starting automation)

- | | |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none">■ objectives<ul style="list-style-type: none">- demonstrate tool value- gain experience / expertise in tool use- identify changes to existing test process- set internal standards and conventions- refine assessment of costs and achievable benefits | <ul style="list-style-type: none">■ benefits<ul style="list-style-type: none">- find the best way for you (best practice)- overcome problems once- establish own expertise- establish confidence (based on experience)- set realistic targets |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Pilot project scope

- **small**
 - 3 to 6 months work for 3 to 6 people
 - a few tens of tests
 - **non-critical**
 - not on the critical path of any project
 - will be a bonus if successful
 - **important**
 - automate useful tests
-

Characteristics of a pilot project

Planned	resourced, targets, contingency
Important	full time work, worthwhile tests
Learning	informative, useful, revealing
Objective	quantified, not subjective
Timely	short term, focused

Recharging Test Automation

Is your automation in need of recharging?

Instigating a pilot project

Objectives

Organisational structures

Measuring to monitor and set targets

Explore implementation

■ objective

- learn how to use the tool
 - what it can do well
 - what it cannot do
- explore different implementations of same tests
 - looking to make it easy to build and understand

■ approach

- automate only a few (useful) tests (10 - 20?)
- use stable software

Explore maintenance

- **objective**
 - learn how to maintain scripts
 - explore ways of implementing scripts
 - looking to reduce maintenance burden for most likely software changes
 - easy maintenance
 - **approach**
 - run tests on different stable version of software
-

Explore failure analysis

- **objective**
 - learn how to analyse failures
 - explore different implementations
 - looking to make it easy to analyse failures
- **approach**
 - use unstable software

Other areas to explore

- **naming conventions**
 - conformity
 - **reporting options**
 - format and content
 - **measurement**
 - benefits and costs
 - **testware architecture**
 - configuration management
-

Is your automation in need of recharging?

Instigating a pilot project

Objectives

Organisational structures

Measuring to monitor and set targets

Option 1: Testers automate tests

■ advantages

- no separate team required

■ disadvantages

- not all testers can automate (well)
- not all testers want to automate
- conflict of responsibilities
- conflict of interests
 - automate tests
 - run manual tests

Option 2: Separate automation team

- **size**
 - could be 2 or more people
 - programming skill
 - interest in using test tool
 - **advantages**
 - separation of responsibilities
 - best use of skills
 - **disadvantages**
 - “us and them” syndrome
 - inappropriate tests automated?
-

Test team responsibilities

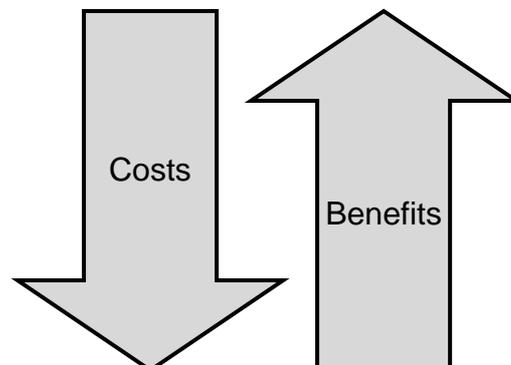

- **testing the software**
 - design/select tests for automation
 - requires planning / negotiation
- **execute automated tests**
 - automation regime must allow this
- **analyse failed automated tests**
 - perhaps with help from automation team
 - test failures

Automation team responsibilities

- **deliver**
 - automated tests (tests given to them)
 - supported automated testing regime
 - allowing testers to execute automated tests
 - providing additional (home-grown) tools
 - **predict**
 - maintenance effort for software changes
 - cost of automating new tests
 - **improve automation methods**
-

Improve automation methods

- **decreasing: (average per test)**
 - build cost
 - maintenance cost
 - failure analysis cost
- **increasing**
 - savings
 - ease of use
 - flexibility

Is your automation in need of recharging?

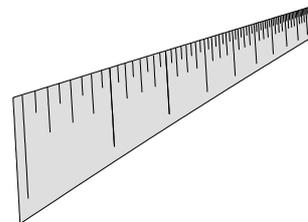

Instigating a pilot project

Objectives

Organisational structures

Measuring to monitor and set targets

Useful measures

- **a useful measure:**

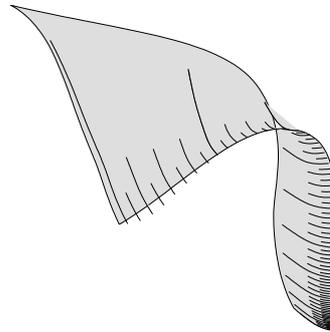

“supports effective analysis and decision making, and that can be obtained relatively easily.”

Bill Hetzel, “Making Software Measurement Work”, QED, 1993.

- **easy measures may be more useful even though less accurate (e.g. car fuel economy)**
- **‘useful’ depends on objectives, i.e. what you want to know**

Automation measures

- **aspects of automation**
 - number of automated tests
 - number of automation scripts
 - time to run the automated tests
 - effort saved by automation runs
 - effort to automate new tests
 - effort to analyse failed automated tests
 - effort to maintain automated tests
 - number of test failures caused by one s/w fault

Measure benefit

- **equivalent manual test effort (EMTE)**
 - hours of additional testing
 - hours of unattended testing
- **number of tests**
 - tests performed
 - additional (new) tests
 - repeated tests
- **number of test cycles**
 - additional cycles

Suggestion

Relate target to total cost of automation, e.g. benefit 10 times total cost

Measure build effort

- **time taken to automate tests**
 - hours to add new or existing manual tests
 - average across different test types
- **proportion of equivalent manual test effort**
 - e.g. 1 hour to automate 30 minute manual test
= 2 times equivalent manual test effort

Suggestion

Target:	< 2 times
Trend:	decreasing 10% per year

Measure failure analysis effort

- **analysis effort for each test**
 - captured in fault report
 - effort from first recognition through to resumption of test execution
 - average hours (or minutes) per failed test case

Suggestion

Target:	15 minutes
Trend:	stable

Measure maintenance effort

- **maintenance effort of automated tests**
 - percentage of test cases requiring maintenance
 - average effort per test case
 - percentage of equivalent manual test effort

Suggestion

Target:	< 10%
Trend:	stable or decreasing

Recharging Test Automation

Summary: key points

- **a new pilot project to focus on improvement**
 - start with specific objectives, build on knowledge
- **organisational structures are important**
 - ensure there is specific automation responsibility
- **measure and monitor**
 - set realistic but challenging targets
